Course Information

Stata provides different graphic commands for different types of data. This Stata tutorial explains how to use the program's graph commands for data visualization and covers histograms, box plots, density plots, bar charts, pie charts, scatter plots, line plots, bubble plots and best-fit lines. We show you how to use Stata to draw graphs for a single continuous variable, a single categorical variable, two continuous variables, two categorical variables and one continuous variable and one categorical variable.

We explore the Stata graph options used to customize markers, lines, axes, labels, titles and legends. The course demonstrates how to modify various graphs' symbols, colors, patterns and text to make them more attractive and informative, which can improve the quality of presentations and publications. We then teach you how to overlay multiple plots in a graph and combine multiple graphs into a single version.

Finally, the course explains how to save and export graphs to different formats. Graphs and data visualization effectively display variables and their relationships. Graphs are widely used in business, statistical analysis and empirical research in every academic field. Learning how to use Stata enhances your professional portfolio as data science plays a key role in many industries. Sign up for this Stata tutorial to improve your ability to analyze, visualize and present data.

Modules Studied

Module 1: Distribution of a Single Variable

Module 2: Relationship between Two Variables

Module 3: Graph Options

Module 4: Course assessment
